Map-Reduce Applications: Counting, Graph Shortest Paths

Adapted from UMD Jimmy Lin’s slides, which is licensed under a Creative Commons Attribution-Noncommercial-Share Alike 3.0 United States. See http://creativecommons.org/licenses/by-nc-sa/3.0/us/ for details
Overview

- Simple counting, averaging
- Graph problems and representations
- Parallel breadth-first search
MapReduce: Recap

- Programmers must specify:
  \[ \text{map} \ (k, v) \rightarrow <k', v'>^* \]
  \[ \text{reduce} \ (k', v') \rightarrow <k', v'>^* \]
  - All values with the same key are reduced together

- Optionally, also:
  \[ \text{partition} \ (k', \text{number of partitions}) \rightarrow \text{partition for } k' \]
  - Often a simple hash of the key, e.g., \( \text{hash}(k') \mod n \)
  - Divides up key space for parallel reduce operations
  \[ \text{combine} \ (k', v') \rightarrow <k', v'>^* \]
  - Mini-reducers that run in memory after the map phase
  - Used as an optimization to reduce network traffic

- The execution framework handles everything else…
“Everything Else”

- The execution framework handles everything else...
  - Scheduling: assigns workers to map and reduce tasks
  - "Data distribution": moves processes to data
  - Synchronization: gathers, sorts, and shuffles intermediate data
  - Errors and faults: detects worker failures and restarts

- Limited control over data and execution flow
  - All algorithms must expressed in m, r, c, p

- You don’t know:
  - Where mappers and reducers run
  - When a mapper or reducer begins or finishes
  - Which input a particular mapper is processing
  - Which intermediate key a particular reducer is processing
Shuffle and Sort: aggregate values by keys

- **map**
  - k_1 v_1
  - k_2 v_2
  - k_3 v_3
  - k_4 v_4
  - k_5 v_5
  - k_6 v_6

- **combine**
  - a 1 b 2
  - c 3 c 6

- **partition**
  - partition
  - partition
  - partition

- **map**
  - a 5 c 2
  - b 7 c 8

- **combine**
  - c 9

- **map**
  - a 5 c 2
  - b 7 c 8

- **partition**
  - partition
  - partition

- **map**
  - b 7 c 8

- **combine**
  - combine

- **reduce**
  - reduce
  - reduce

- **reduce**
  - r_1 s_1
  - r_2 s_2
  - r_3 s_3
Word Count: Baseline

```java
1: class Mapper
2:    method MAP(docid a, doc d)
3:        for all term t ∈ doc d do
4:            Emit(term t, count 1)
1: class Reducer
2:    method REDUCE(term t, counts [c₁, c₂, ...])
3:        sum ← 0
4:        for all count c ∈ counts [c₁, c₂, ...] do
5:            sum ← sum + c
6:        Emit(term t, count s)
```

What’s the impact of combiners?
1: class Mapper
2:   method MAP(docid a, doc d)
3:     H ← new AssociativeArray
4:     for all term t ∈ doc d do
5:         H{t} ← H{t} + 1  ▷ Tally counts for entire document
6:     for all term t ∈ H do
7:         EMIT(term t, count H{t})
class Mapper
method INITIALIZE
    \( H \leftarrow \text{new AssociativeArray} \)
method MAP(docid a, doc d)
    for all term \( t \in \text{doc d} \) do
        \( H\{t\} \leftarrow H\{t\} + 1 \)
    ▷ Tally counts across documents
method CLOSE
    for all term \( t \in H \) do
        EMIT(term \( t \), count \( H\{t\} \))

Key: preserve state across input key-value pairs!
Design Pattern for Local Aggregation

- “In-mapper combining”
  - Fold the functionality of the combiner into the mapper by preserving state across multiple map calls

- Advantages
  - Speed
  - Faster than actual combiners

- Disadvantages
  - Explicit memory management required
  - Potential for order-dependent bugs
Combiner Design

- Combiners and reducers share the same method signature
  - Sometimes, reducers can serve as combiners
  - Often, not…

- Remember: combiner are optional optimizations
  - Should not affect algorithm correctness
  - May be run 0, 1, or multiple times

- Example: find average of all integers associated with the same key
Computing the Mean: Version 1

1: class Mapper
2:   method Map(string t, integer r)
3:     Emit(string t, integer r)

1: class Reducer
2:   method Reduce(string t, integers \([r_1, r_2, \ldots]\))
3:     sum \leftarrow 0
4:     cnt \leftarrow 0
5:     for all integer \(r \in \text{integers} \,[r_1, r_2, \ldots]\) do
6:         sum \leftarrow sum + r
7:         cnt \leftarrow cnt + 1
8:     r_{avg} \leftarrow sum/cnt
9:     Emit(string t, integer \(r_{avg}\))
Single Source Shortest Path

- Problem: find shortest path from a source node to one or more target nodes
  - Shortest might also mean lowest weight or cost
- First, a refresher: Dijkstra’s Algorithm
Dijkstra’s Algorithm Example

Example from CLR

Finding the Shortest Path

- Consider simple case of equal edge weights
- Solution to the problem can be defined inductively
- Here’s the intuition:
  - Define: \( b \) is reachable from \( a \) if \( b \) is on adjacency list of \( a \)
  - \( \text{DISTANCETo}(s) = 0 \)
  - For all nodes \( p \) reachable from \( s \), \( \text{DISTANCETo}(p) = 1 \)
  - For all nodes \( n \) reachable from some other set of nodes \( M \), \( \text{DISTANCETo}(n) = 1 + \min(\text{DISTANCETo}(m), \ m \in M) \)
Visualizing Parallel BFS

The diagram represents a network of nodes labeled $n_0$ to $n_9$. The nodes are color-coded to indicate different layers or stages in a parallel breadth-first search (BFS) algorithm.
From Intuition to Algorithm

- **Data representation:**
  - Key: node $n$
  - Value: $d$ (distance from start), adjacency list (list of nodes reachable from $n$)
  - Initialization: for all nodes except for start node, $d = \infty$

- **Mapper:**
  - $\forall m \in$ adjacency list: emit $(m, d + 1)$

- **Sort/Shuffle**
  - Groups distances by reachable nodes

- **Reducer:**
  - Selects minimum distance path for each reachable node
  - Additional bookkeeping needed to keep track of actual path
Multiple Iterations Needed

- Each MapReduce iteration advances the “known frontier” by one hop
  - Subsequent iterations include more and more reachable nodes as frontier expands
  - Multiple iterations are needed to explore entire graph

- Preserving graph structure:
  - Problem: Where did the adjacency list go?
  - Solution: mapper emits \((n, \text{adjacency list})\) as well
BFS Pseudo-Code

1: class Mapper
2:   method Map(nid n, node N)
3:       \( d \leftarrow N.\text{Distance} \)
4:       Emit(nid n, N)  ▷ Pass along graph structure
5:       for all nodeid \( m \in N.\text{AdjacencyList} \) do
6:           Emit(nid m, \( d + 1 \))  ▷ Emit distances to reachable nodes

1: class Reducer
2:   method Reduce(nid m, \([d_1, d_2, \ldots]\))
3:       \( d_{\text{min}} \leftarrow \infty \)
4:       \( M \leftarrow \emptyset \)
5:       for all \( d \in \text{counts} \) \([d_1, d_2, \ldots]\) do
6:           if IsNode(d) then
7:               \( M \leftarrow d \)  ▷ Recover graph structure
8:           else if \( d < d_{\text{min}} \) then
9:               \( d_{\text{min}} \leftarrow d \)  ▷ Look for shorter distance
10:          \( M.\text{Distance} \leftarrow d_{\text{min}} \)
11:          Emit(nid m, node M)  ▷ Update shortest distance
### Example: SSSP – Parallel BFS in MapReduce

#### Adjacency matrix

<table>

</tbody>
</table>

#### Adjacency List

- **A:** (B, 10), (D, 5)
- **B:** (C, 1), (D, 2)
- **C:** (E, 4)
- **D:** (B, 3), (C, 9), (E, 2)
- **E:** (A, 7), (C, 6)
Example: SSSP – Parallel BFS in MapReduce

- Map input: <node ID, <dist, adj list>>
  - <A, <0, <(B, 10), (D, 5)>>>
  - <B, <inf, <(C, 1), (D, 2)>>>
  - <C, <inf, <(E, 4)>>>
  - <D, <inf, <(B, 3), (C, 9), (E, 2)>>>
  - <E, <inf, <(A, 7), (C, 6)>>>

- Map output: <dest node ID, dist>
  - <B, 10> <D, 5>
  - <C, inf> <D, inf>
  - <E, inf>
  - <B, inf> <C, inf> <E, inf>
  - <A, inf> <C, inf>

Flushed to local disk!!
Example: SSSP – Parallel BFS in MapReduce

- Reduce input: \langle \text{node ID, dist} \rangle

\langle A, 0, \langle B, 10 \rangle, \langle D, 5 \rangle \rangle

\langle A, \infty \rangle

\langle B, \infty, \langle C, 1 \rangle, \langle D, 2 \rangle \rangle

\langle B, 10 \rangle \langle B, \infty \rangle

\langle C, \infty, \langle E, 4 \rangle \rangle

\langle C, \infty \rangle \langle C, \infty \rangle \langle C, \infty \rangle

\langle D, \infty, \langle B, 3 \rangle, \langle C, 9 \rangle, \langle E, 2 \rangle \rangle

\langle D, 5 \rangle \langle D, \infty \rangle

\langle E, \infty, \langle A, 7 \rangle, \langle C, 6 \rangle \rangle

\langle E, \infty \rangle \langle E, \infty \rangle
Example: SSSP – Parallel BFS in MapReduce

- Reduce input: <node ID, dist>

- \( (A, 0, ((B, 10), (D, 5))) \)
- \( (A, \infty) \)

- \( (B, \infty, ((C, 1), (D, 2))) \)
- \( (B, 10, (B, \infty)) \)

- \( (C, \infty, ((E, 4))) \)
- \( (C, \infty) \)
- \( (C, \infty) \)
- \( (C, \infty) \)

- \( (D, \infty, ((B, 3), (C, 9), (E, 2))) \)
- \( (D, 5, (D, \infty)) \)

- \( (E, \infty, ((A, 7), (C, 6))) \)
- \( (E, \infty) \)
- \( (E, \infty) \)
Example: SSSP – Parallel BFS in MapReduce

- **Reduce output**: `<node ID, <dist, adj list>> = Map input for next iteration`
  
  - `<A, <0, <(B, 10), (D, 5)>>>`
  - `<B, <10, <(C, 1), (D, 2)>>>`
  - `<C, <inf, <(E, 4)>>>`
  - `<D, <5, <(B, 3), (C, 9), (E, 2)>>>`
  - `<E, <inf, <(A, 7), (C, 6)>>>`

- **Map output**: `<dest node ID, dist>`

  - `<B, 10> <D, 5>`
  - `<C, 11> <D, 12>`
  - `<E, inf>`
  - `<B, 8> <C, 14> <E, 7>`
  - `<A, inf> <C, inf>`
  - `<B, <10, <(C, 1), (D, 2)>>>`
  - `<C, <inf, <(E, 4)>>>`
  - `<D, <5, <(B, 3), (C, 9), (E, 2)>>>`
  - `<E, <inf, <(A, 7), (C, 6)>>>`

Flushed to DFS!!

Flushed to local disk!!
Example: SSSP – Parallel BFS in MapReduce

- Reduce input: <node ID, dist>

  <A, <0, [(B, 10), (D, 5)]>
  <A, inf>

  <B, [10, [(C, 1), (D, 2)]]>
  <B, 10> <B, 8>

  <C, [inf, [(E, 4)]]>
  <C, 11> <C, 14> <C, inf>

  <D, [5, [(B, 3), (C, 9), (E, 2)]]>
  <D, 5> <D, 12>

  <E, [inf, [(A, 7), (C, 6)]]>
  <E, inf> <E, 7>
Example: SSSP – Parallel BFS in MapReduce

- Reduce input: <node ID, dist>

- A, <0, (B, 10), (D, 5)>
- A, inf

- B, <10, (C, 1), (D, 2)>
- B, 10, B, 8

- C, inf, (E, 4)
- C, 11, C, 14, C, inf

- D, <5, (B, 3), (C, 9), (E, 2)>
- D, 5, D, 12

- E, inf, (A, 7), (C, 6)
- E, inf, E, 7
Example: SSSP – Parallel BFS in MapReduce

- Reduce output: `<node ID, <dist, adj list>>`  
  = Map input for next iteration

```
<A, <0, <(B, 10), (D, 5)>>>
<B, <8, <(C, 1), (D, 2)>>>
<C, <11, <(E, 4)>>>
<D, <5, <(B, 3), (C, 9), (E, 2)>>>
<E, <7, <(A, 7), (C, 6)>>>

... the rest omitted ...
```
Stopping Criterion

- How many iterations are needed in parallel BFS (equal edge weight case)?
- Convince yourself: when a node is first “discovered”, we’ve found the shortest path
- Now answer the question...
  - Six degrees of separation?
- Practicalities of implementation in MapReduce
Comparison to Dijkstra

- **Dijkstra’s algorithm is more efficient**
  - At any step it only pursues edges from the minimum-cost path inside the frontier

- **MapReduce explores all paths in parallel**
  - Lots of “waste”
  - Useful work is only done at the “frontier”

- **Why can’t we do better using MapReduce?**
Weighted Edges

- Now add positive weights to the edges
  - Why can’t edge weights be negative?
- Simple change: adjacency list now includes a weight \( w \) for each edge
  - In mapper, emit \((m, d + w_p)\) instead of \((m, d + 1)\) for each node \( m \)
Stopping Criterion

- How many iterations are needed in parallel BFS (positive edge weight case)
  - Graph diameter $D$

- Convince yourself: when a node is first “discovered”, we’ve found the shortest path

Not true!
Additional Complexities

- Search frontier

Graph with nodes labeled s, p, r, q, n₁, n₂, n₃, n₄, n₅, n₆, n₇, n₈, n₉.
Stopping Criterion

- How many iterations are needed in parallel BFS (positive edge weight case)?
- Practicalities of implementation in MapReduce
Graphs and MapReduce

- **Graph algorithms typically involve:**
  - Performing computations at each node: based on node features, edge features, and local link structure
  - Propagating computations: “traversing” the graph

- **Generic recipe:**
  - Represent graphs as adjacency lists
  - Perform local computations in mapper
  - Pass along partial results via outlinks, keyed by destination node
  - Perform aggregation in reducer on inlinks to a node
  - Iterate until convergence: controlled by external “driver”
  - Don’t forget to pass the graph structure between iterations
public class Dijkstra extends Configured implements Tool {
    public static String OUT = "outfile";
    public static String IN = "inputlarger";
    public static class TheMapper extends Mapper<LongWritable, Text, LongWritable, Text> {
        public void map(LongWritable key, Text value, Context context) throws IOException, InterruptedException {
            Text word = new Text();
            String line = value.toString(); // looks like 1 0 2:3:
            String[] sp = line.split(" "); // splits on space
            int distanceadd = Integer.parseInt(sp[1]) + 1;
            String[] PointsTo = sp[2].split(":");
            for (int i = 0; i < PointsTo.length; i++) {
                word.set("VALUE " + distanceadd); // tells me to look at distance value
                context.write(new LongWritable(Integer.parseInt(PointsTo[i])), word);
                word.clear();
            }
            // pass in current node's distance (if it is the lowest distance)
            word.set("VALUE " + sp[1]);
